Patient ID: 1698	Date: 18/02/2023

CEMRI LEFT ARM

MR IMAGING OF RIGHT ARM PERFORMED USING T1W, T2W AND STIR CORONAL AND AXIAL IMAGES AND CORRELATED WITH T2W SAGITTAL IMAGES.

FINDINGS:

Study reveals bony destructive mass lesion with wide zone of transition in humerus. No extension seen into shoulder joint. There is destruction of anterior, medial, lateral and posterior cortex of humerus with associated adjoining large soft tissue component. The lesion appears hypointense on T1 and hyperintense on T2 / STIR images. The mass is away from neurovascular bundle. There is involvement of adjoining para-articular arm muscles. The lesion measures 9.2 x 5.6 x 5.6 cm.

Post GAD heterogeneous enhancement is seen.

Rest of the muscles of arm shows normal signal intensity.

Olecranon and coronoid process of ulna, trochlea and radial head are unremarkable.

Rest of the joint appear normal.

Radiohumeral, proximal and distal radio ulnar joints do not reveal any abnormality.

No intraarticular bony fragment or loose body seen.

No fluid collection, hematoma or abscess formation seen within.

The radius and ulna appear normal. No evidence of any altered signals intensity is seen.

IMPRESSION: MR findings reveal bony destructive lesion in humerus involving metadiaphysis with destruction of cortex with associated soft tissue component as described - Neoplastic lesion (Osteosarcoma).

Please correlate clinically.

Dr. SANDEEP DUA
HOD Radiology
MBBS, MD

The above report is a professional opinion and needs to be correlated with clinical history and other relevant investigation for final diagnosis. If incase results are alarming or unexpected may be due to typographic errors, hence please contact within 7 days. (K)

S/O राम कीरत, टंडवा फरीदपुर, जमलपुर, अम्बेडकर नगर,
जमालपुर, उत्तर प्रदेश, 224147 है और मेरा एक बेटा
है जिसका नाम वैभव है और, इसकी आयु 12 years है,
मेरे बेटे को Bone Cancer है, और इसका इलाज Delhi AIIMS
में चल रहा है, इसकी UHID-106541610 है, इसके इलाज
का खर्च 1,72,000 है, जो कि मैं यह खर्च उठाने में असमर्थ
हूँ।

अतः आपसे निवेदन है कि मेरे बेटे का इलाज कराने
में मेरी सहायता करें।

धन्यवाद

आपका प्रार्थी

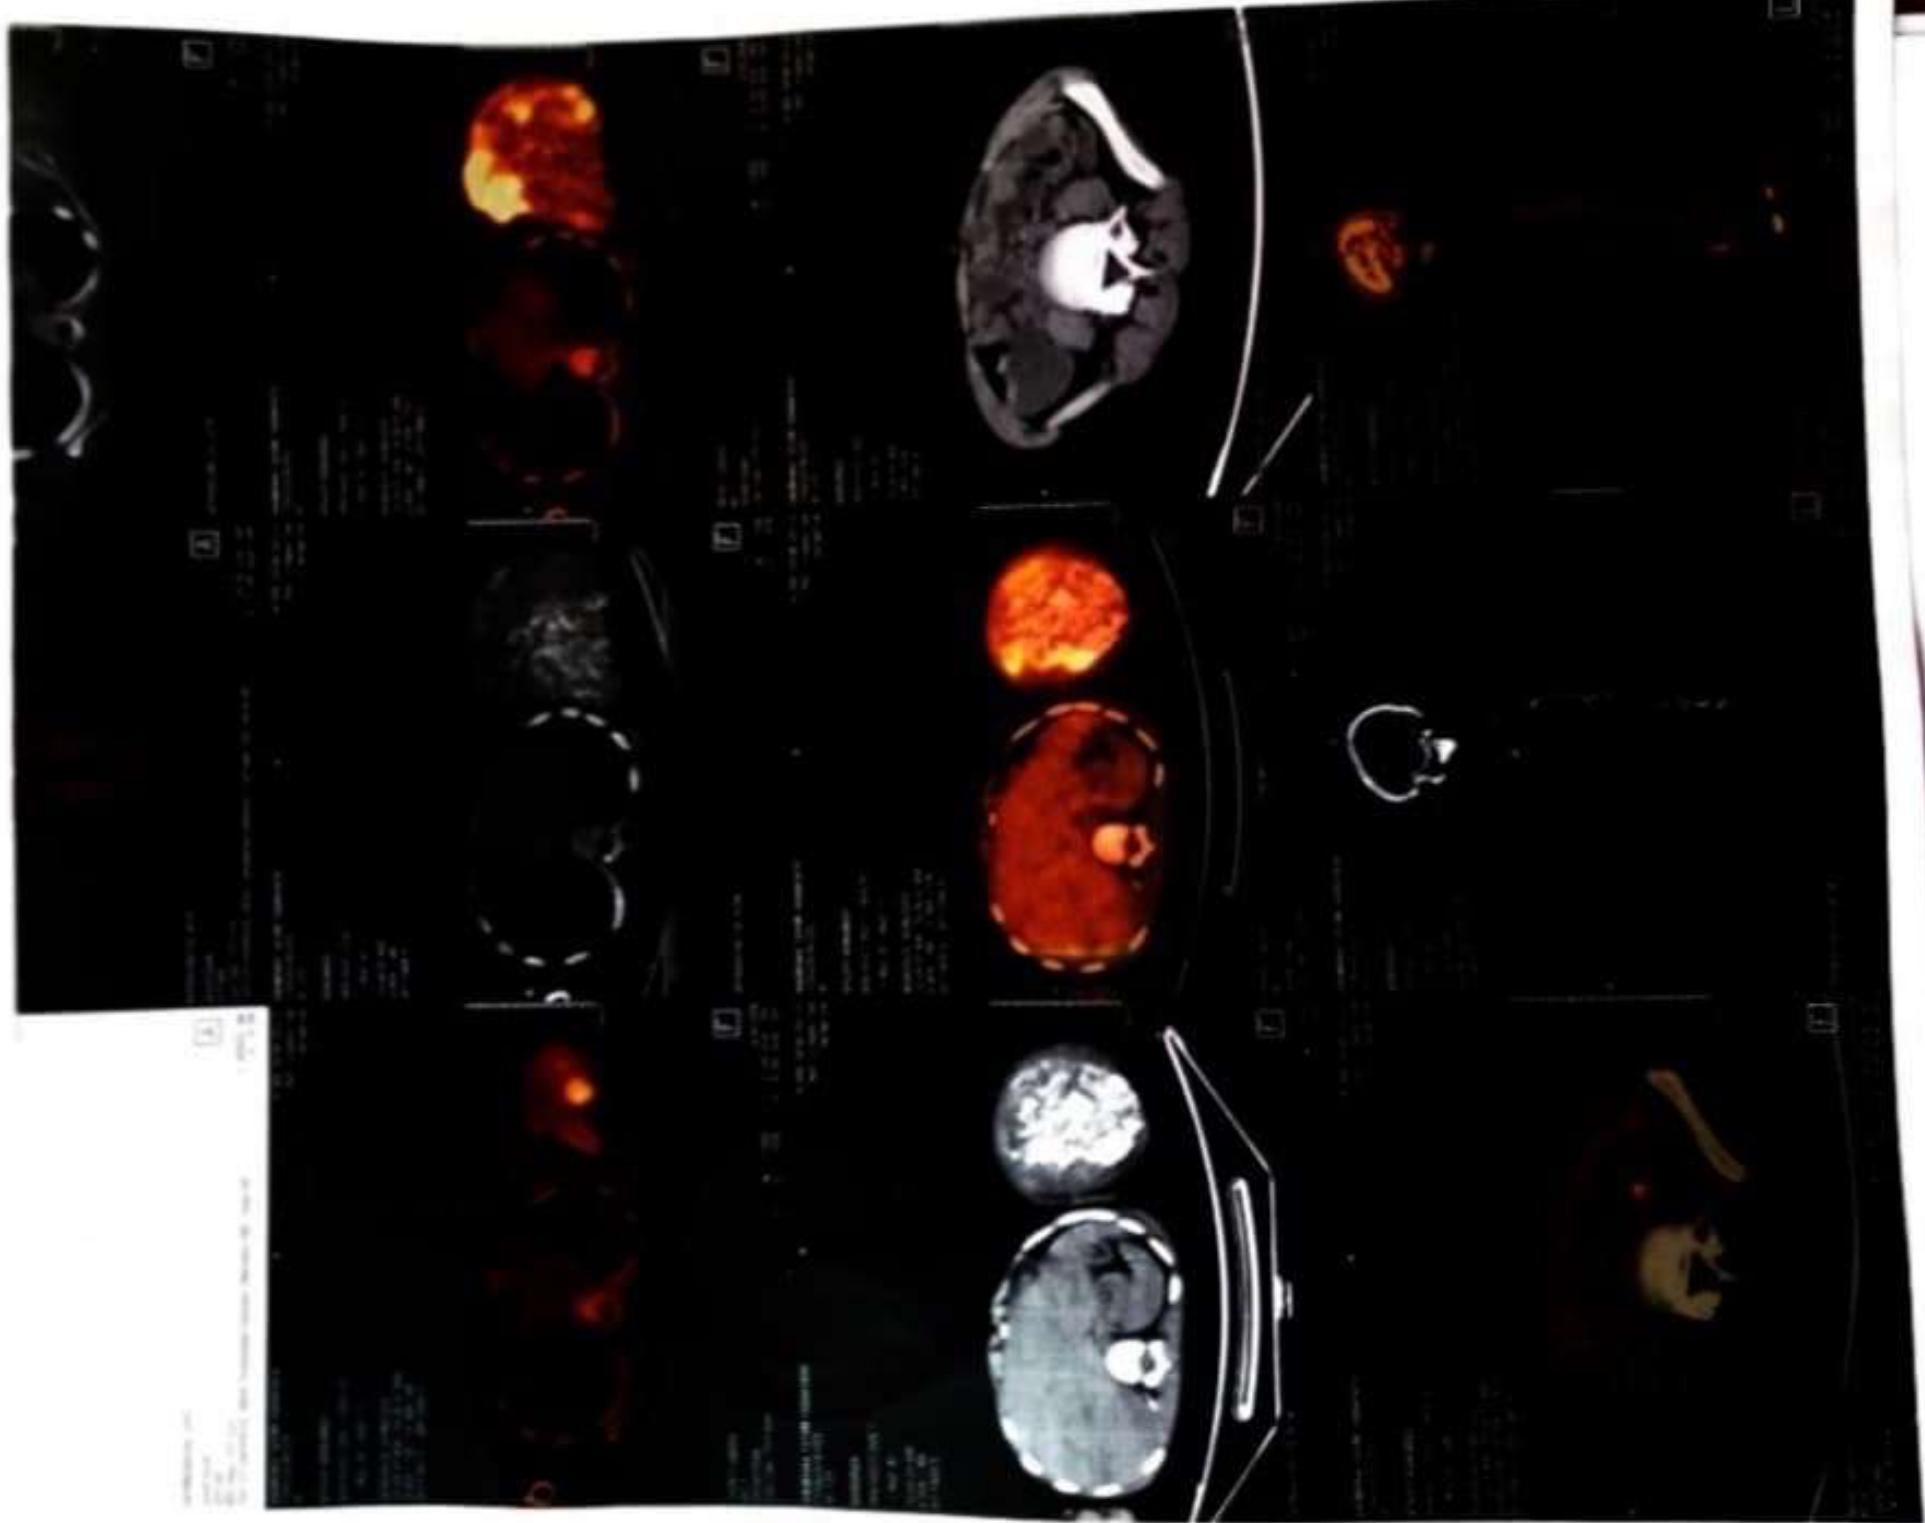

नाम - शिव कुमार

Histopathology Report

Report Findings:

Core biopsy from left proximal humerus shows fibrocollagenous tissue infiltrated by numerous epithelioid cell granulomas, necrosis and many multinucleated langhan and foreign body giant cells. Special stain does not reveal fungal profiles and acid fast bacilli. Features are those of a granulomatous inflammation.
 Kindly correlate with geneXpert studies.

¹⁸F-FDG WHOLE BODY PET-CT STUDY

Patient Name: Vaibhav		Age/Sex: 12 Y/ M
Study ID: FDG/24787/23	UHID: 106541610	Date: 26.06. 2023

Indication: c/o metastatic osteosarcoma, post 2 cycles of CDDP, PET-CT for disease status.

Procedure: PET-CT acquisition was done 60 minutes after injection of 10 mCi ¹⁸F-FDG by intravenous route, from the level of orbits to mid-thigh. CT was done for attenuation correction and anatomical localization.

PET-CT Findings:

Head and Neck: Increased FDG uptake noted in bilateral palatine tonsils. FDG avid bilateral level II and IV cervical lymph nodes noted largest measuring ~ 1.3 x 1.0 cm (right level II). Non FDG avid polyp noted in right maxillary sinus. Visualized skull base, pharynx, larynx and thyroid do not show any abnormality on CT.

Thorax: Multiple non FDG avid subcentimetric bilateral subpleural and parenchymal lung nodules in random distribution noted some showing calcification. Multiple mildly FDG avid left axillary lymph nodes I and II noted largest measuring ~ 1.2 x 1.0 cm (left axillary level I). Few paratracheal, prevascular, AP window, subcarinal and bilateral hilar lymph nodes noted, some of them showing calcifications and no significant FDG uptake – likely infective. Physiological FDG uptake is seen in the myocardium. Large airways, pleura, heart, great vessels and other mediastinal structures appear normal on CT.

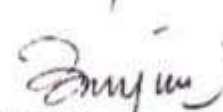

Abdomen-Pelvis: Few sub-centimetric bilateral inguinal lymph nodes noted with preserved fatty hilum. Normal FDG distribution is noted in the liver, spleen, kidneys, gastrointestinal tract and urinary bladder. Liver, biliary ducts, gall bladder, spleen, kidneys, stomach, adrenals, pancreas, retroperitoneum, bowel and urinary bladder appear normal on CT. No ascites is noted.

Musculo-Skeletal System: FDG avid large exophytic heterogeneous density mass noted in left proximal humerus measuring ~ 12.2 x 12.0 cm with areas of coarse internal calcification. Muscle adjacent to the mass is not separable from the mass. Physiological FDG distribution is seen in the rest of visualized axial and appendicular skeleton.

IMPRESSION:

- Metabolically active large exophytic heterogeneous density mass in left proximal humerus – primary with metastasis to bilateral lungs and ? left axillary lymph nodes.
