REPORTS

TEST NAME

RESULT

UNITS

REF.RANGE

CRP (Quantitative)

14.1

mg/L

(Adult up to 6.0)

Comments

The CRP test is useful in patient with Inflammatory bowel disease arthritis, Autoimmune diseases, Pelvic inflammatory disease (PID). While the CRP test is not specific enough to diagnose a particular disease, it does serve as a general marker for infection and inflammation. An increased amount of CRP in your blood suggests that you have an acute infection or inflammation. If the CRP level in your blood drops, it means that you are getting better and inflammation is being reduced. CRP levels can be elevated in the later stages of pregnancy as well as with use of birth control pills or hormone replacement therapy i.e. estrogen). Higher levels of CRP have also been observed in the obese. Another test to monitor inflammation is called the Erythrocyte Sedimentation Rate (ESR). Both tests are elevated in the presence of inflammation; however, CRP appears and then disappears sooner than changes in the ESR. Thus, your CRP level may fall to normal if you have been treated successfully, such as for a flare-up of arthritis, but your ESR may still be abnormal for a while longer.
